Abstract

Presenting content about Simulation of space travel: Before humans journey to other planets or colonize the moon, we still need a lot of practice in simulating realistic space travel experiences. The National Geographic Museum of Exploration opens: This brand-new museum in Washington, D.C., aims to spark the explorer in every visitor. Wonders of the Eagle's Land: On the 250th anniversary of the United States, we celebrate by showcasing the best of the land. From unsightly cultural symbols in many U.S. national parks, structures once considered ugly have become cherished landmarks. Unveiling the secrets of mummies: The world's only mummy research institute is revolutionizing our understanding of the lives of ancient human ancestors. Green bottle flies may help stop wild-borne pandemics: These lowly insects, known for feeding on dung and carrion, are being used by one researcher as a new biological warning system for survival. Successfully developing a critically needed vaccine may be the key to saving koalas from devastating disease. Serpents guarding the mountains: High in the cloud forests of western Honduras. The rare jade palm snake has become a symbol of an endangered ecosystem.
